## IVD AND POCT PRODUCTS MANUFACTURER

**SARS-CoV-2 antigen IVD kit (Colloidal Gold Method)**

**Product Open Bag Stability Test Report**

**REAGEN**

## **1. Purpose**

This report is intended to evaluate the product open bag stability of SARS-CoV-2 antigen IVD kit (Colloidal Gold Method).

## **2. Reference**

- 2.1 Colloidal Gold Immunochromatography Assay Kit 2018-07-10 .
- 2.2 Guidance for the technical review of registration of pathogen-specific M-type immunoglobulin qualitative detection reagents.
- 2.3 "Key Points of Technical Review of SARS-CoV-2 Antigen Detection Reagent Registration in 2019 (Trial)"

## **3. Material**

Table 1:Material List

| Product   | Spec        | Lot      | Manufacturer                         | Note              |
|---|-------------|----------|--------------------------------------|-------------------|
| SARS-CoV-2 antigen IVD kit(Colloidal Gold Method) | 20Cards/box | 20201018 | Shenzhen Reagent Technology Co.,Ltd. | Kits to be tested |
|   |             | 20201019 |                                      |                   |
|   |             | 20201020 |                                      |                   |

## **4. Acceptance Criteria**

### **4.1 Appearance**

Out package should be completed without any damaged. Labelling should be clear. Test Strip should be clean, complete, without any damage or contamination. Sample Extraction Buffer should be transparent liquid, without any floccule or sediment.

### **4.2 Strip width**

Strip width should be no less than 2.5mm.

### **4.3 Liquid migration velocity**

Liquid migration velocity should be no less than 10mm/min.

### **4.4 Detection Limit**

Use manufacturer's reference perform test. Results of L01, L02 reference should be

negative. Results of L05, L06 reference should be positive. Results of L03, L04 reference can either negative or positive.

#### 4.5 Negative reference consistency rate

Use manufacturer's negative reference perform test. All test results should be negative. Negative consistency rate is (-/-)10/10.

#### 4.6 Positive reference consistency rate

Use manufacturer's positive reference perform test. All test results should be positive.

Positive consistency rate is (+/+)5/5

#### 4.7 Repeatability

Use manufacturer's negative reference R01 and manufacturer's weakly positive reference R02 test 20 times respectively. Negative consistency range and positive consistency rate should be no less than 95%.

### 5. Test Method

Because high temperature and high humidity will affect strip performance, this evaluation is focus on these two aspects. Choose 3 lots test strips. Take out Sample Extraction Buffer, open and close cap immediately, stored at 4~30°C. Take out strips from foil pouch, then put the strips at different temperature/humidity condition for 0min, 10min, 20min, 30min. Test appearance, strip width, liquid moving velocity, detection limit, negative consistency range, positive consistency rate and repeatability.

Environment condition are as below:

- (1) RH 50%, 25°C;
- (2) RH 50%, 40°C;
- (3) RH 90%, 25°C

## 6. Test Result

Table 2-test Result

Note: Take example as 100% (20/20-),100% means positive rate,“20/20-”means 20 test results are negative in 20 tests .

According to table 2, SARS-CoV-2 antigen IVD kit meet acceptance criteria at each environment condition within open 20 minutes.After open 20 minutes,test results failed when humidity is 90%.

## 7. Conclusion

After open the foil bag, SARS-CoV-2 antigen IVD kit meet requirements after opened within 20 minutes. But test results will fail after opened 30 minutes. Therefore, the open bag stability is defined as 10 minutes.
